1 Install the device

1.1 Preparations

You shall prepare the following tools and materials for device installation.

- Rack mounting: ESD bracelet (or ESD gloves), screwdriver, 4 screws (to secure the switch to the rack)
- Wall mounting: ESD bracelet (or ESD gloves), marker, hammer drill, rubber hammer, screwdriver, 4 expansion bolts (M5*40 mm), 4 screws (PA5*25 mm, head diameter: 10 mm)
- Desktop mounting: ESD bracelet (or ESD gloves)

1.2 Installation

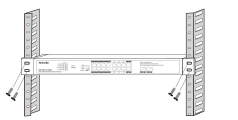
TEG1118P-16-250W is used as an example for illustration here.

• Rack mounting (to a standard 19-inch rack)

Step 1 Ensure that the rack is stable and level, and is properly grounded.

Step 2 Fix the two L-shaped brackets to both sides of the switch using the included screws.

Step 3 Choose a proper height and fix the L-shaped brackets to the rack using screws (self-prepared). Ensure that the switch is seated securely on the rack.



• Wall mounting

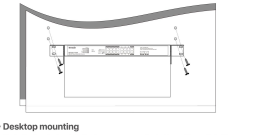
Note: - Do **NOT** install the switch with its air vents facing downward; otherwise, there will be potential safety hazards.
- This switch can only be installed on a concrete or non-flammable wall.

Step 1 Rotate the two L-shaped brackets by 90 degrees and fix them to both sides of the switch with the included screws.

Step 2 Horizontally place the switch onto the wall with its RJ45 ports facing upward. Then mark the screw holes with the marker on the wall.

Step 3 Drill holes in the marked positions with a hammer drill, and then knock the expansion bolts (self-prepared, M5*40 mm) into the holes.

Step 4 Insert the screws (self-prepared, PA5*25 mm, head diameter: 10 mm) through the holes of the two L-shaped brackets, and secure the screws into the expansion bolts with a screwdriver. Ensure that the switch is installed firmly with its RJ45 ports facing upward.

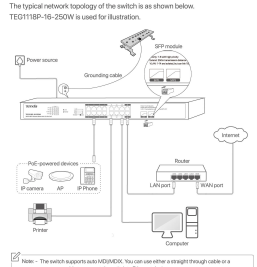


• Desktop mounting

Paste the four footpads to the four recesses on the bottom of the switch. Then turn the switch upside down, and place it on a big enough, clean, stable and flat desktop.

2 Connect the device

The typical network topology of the switch is as shown below. TEG1118P-16-250W is used for illustration.



Note: - The switch supports auto MDI/MDIX. You can use either a straight-through cable or a crossover cable to connect the switch to Ethernet devices.
- The switch supports power supply priorities for the PoE ports. When the total power consumption of the PoE-powered devices exceeds the maximum output of the switch, the switch starts cutting off the power supply from the port with the lowest power supply priority (the port with the largest port number) until the total power consumption of the PoE-powered devices is less than the maximum output of the switch.

After connection, you can check whether the switch is connected properly or change the working mode according to the following table.

LED Indicator/ Toggle	Description
SFP1, SFP2, Link/Act	**Solid on:** The port is connected to a device, but no data is being transmitted over the port. **Blinking:** The port is connected to a device, and data is being transmitted over the port. **Off:** The port is not connected or is not connected properly.
PoE-MAX	**Solid on:** The total PoE output power reaches the maximum output power of the switch. **Off:** The total PoE output power does not reach the maximum output power of the switch.
Power	**Solid on:** The switch is powered on properly. **Off:** The switch is not powered on or not powered on properly.
Working mode toggle	**Standard:** Default mode of the switch. In this mode, the switch works as an ordinary unmanaged switch, and all ports can communicate with each other. **Priority:** In this mode, ports 1 to 8 serve as ports with high priority. All ports can communicate with each other. When multiple IP cameras are connected to the switch, you can use this mode and connect the IP cameras in key surveillance areas to the ports with high priority, and the data devices (such as NAS and router) to the two uplink ports. This guarantees a higher priority for IP cameras in key surveillance areas when network congestion occurs, and improves the smoothness of the monitoring video. **Extend:** In this mode, the port statuses of the switches are as shown below. • For TEG1118P-16-250W, the maximum transmission distance of ports 9 - 14 can reach 250 meters, and all ports can communicate with each other. • For TEG1126P-24-410W, the maximum transmission distance of ports 17 - 22 can reach 250 meters, and all ports can communicate with each other. For a better network extension effect, please use CAT5e Ethernet cables or above, and set the speed and duplex mode of the port of the peer device to Auto-negotiation. If the peer device is an IP camera, set its bit rate below 8 Mbps for timeliness of video transmission. **VLAN:** In this mode, the working statuses of the switches are as shown below. • For TEG1118P-16-250W, ports 1 - 14 cannot communicate with each other, but can communicate with ports 15, 16, SFP1, and SFP2. • For TEG1126P-24-410W, ports 1 - 22 cannot communicate with each other, but can communicate with ports 23, 24, SFP1, and SFP2. VLAN mode helps isolate DHCP broadcast and reduce broadcast storm.
